

Computer Fundamentals Examination - 16 Questions

Model 1

Class: _____	Duration: _____	Date: _____	Teacher: _____
--------------	-----------------	-------------	----------------

Student Name: _____

Class: _____

Multiple Choice Questions

Q1. Which component is responsible for executing instructions in a computer?

- A. RAM
- B. CPU
- C. Monitor
- D. Keyboard

Q2. Which type of memory temporarily stores data that the computer is currently using?

- A. SSD
- B. ROM
- C. RAM
- D. USB

Q3. Which language is commonly used for querying and managing relational databases?

- A. HTML
- B. Python
- C. SQL
- D. CSS

Q4. What does HTML primarily define?

- A. The structure of a web page
- B. Database tables
- C. Computer hardware
- D. Network security

Q5. Which device is mainly used to display visual information from a computer?

- A. Printer
- B. Monitor
- C. Keyboard
- D. Microphone

Q6. Which technology allows devices to communicate wirelessly over short distances?

- A. HDMI
- B. Bluetooth
- C. Ethernet
- D. USB

Q7. Which software is commonly used for image editing and graphic design?

- A. Photoshop
- B. SQL
- C. Python
- D. BIOS

Fill in the Blank

WORD BANK

CPU | RAM | Monitor | Keyboard | Printer | SQL

Q1. The _____ is responsible for processing and executing computer instructions.

Q2. _____ is temporary memory used to store data and programs that are currently being used.

Q3. _____ is a language used to communicate with and manage databases.

True / False

Q1. RAM is a type of temporary memory that loses its data when the computer is turned off.

() True () False

() True () False

() True () False

Q1. Why is RAM important for a computer's performance?

Q1. Explain the main components of a computer system and describe the role of the CPU, RAM, storage, input devices, and output devices. Provide examples of each.

Answer Key - Model 1

Multiple Choice Questions

- Q1. B
- Q2. C
- Q3. C
- Q4. A
- Q5. B
- Q6. B
- Q7. A

Fill in the Blank

- Q1. CPU
- Q2. RAM
- Q3. SQL

True / False

- Q1. True
- Q2. False
- Q3. True

Short Answer

Q1. RAM holds data and programs currently in use so the CPU can access them quickly, improving responsiveness and multitasking performance.

Q2. SQL provides a standard way to create, retrieve, update, organize, and analyze data stored in relational databases.

Essay

Q1. A computer system combines processing, memory, storage, input, and output. The CPU executes instructions and performs calculations. RAM temporarily holds active data and programs. Storage such as an SSD or hard drive retains files and software when power is off. Input devices such as a keyboard, mouse, microphone, and scanner send data to the computer. Output devices such as a monitor, printer, and speakers present processed information to the user. | Key points: CPU executes instructions; RAM provides temporary working memory; storage preserves data long term; input devices send data to the system; output devices present results
